

Correction to Role of the Flavan-3-ol and Galloyl Moieties in the Interaction of (–)-Epigallocatechin Gallate with Serum Albumin

Min Li and Ann E. Hagerman*

J. Agric. Food Chem. **2014**, 62 (17), 3768–3775. DOI [10.1021/jf500246m](https://doi.org/10.1021/jf500246m)

There are two typographical errors in the original paper. The first is in Table 1. The value for the EGCg K_{SV} at pH 7.4 was incorrectly entered as 461. The correct value is 46. The corrected table is provided here:

Table 1. Stern–Volmer Constants Describing BSA Fluorescence Quenching by EGC, EGCg, or MG at pH 3.0, 5.0, and 7.4

	$K_{SV} (\times 10^4 \text{ M}^{-1})$		
	pH 3.0	pH 5.0	pH 7.4
EGCg	1.6	8.0	46 ^a
MG	0.85	0.81	5.4
EGC	0.30	0.23	0.64

^aEstimated as K_a from modified SV plot.

The second error is in the first sentence under Discussion, where an exponent is incorrectly written as 10^{-5} .

The correct sentence is as follows: Our fluorescence studies demonstrated that EGCg interacts with BSA, with an apparent binding constant of about $4.6 \times 10^5 \text{ M}^{-1}$ at pH 7.4, similar to that obtained in other studies of EGCG–BSA interactions²⁰ and about 10-fold higher than that reported for EGCg–HSA.^{18,19}
