

from the specialists
in liquid chromatography

Just what you need for LC at 3000 psi.

If you do high-pressure liquid chromatography, these new Chromatronix accessories can make your job a lot easier.

Sample injection valve. Stainless steel valve injects successive samples of identical volume at pressures up to 3000 psi. External, replaceable sample loop of 20, 100 or 500 μ l.

Columns. $\frac{1}{4}$ " O.D. stainless steel columns with easily removable bed support filters. 2mm bore. 500 and 1000 mm lengths.

Newest packings. High-efficiency packings with superficially porous, chemically bonded phases for adsorption, reverse-phase and ion-exchange chromatography.

Automatic column packer. Motorized time-saver feeds dry packing into column and packs it to uniform, reproducible density. Packs columns up to 1 m long.

Also available are complete chromatographs, detectors and recorders, plus switching valves and fittings. Contact Chromatronix, Inc., 2743 Ninth Street, Berkeley, CA 94710. Phone (415) 841-7221.

Work supported by the National Institutes of Health Grant No. GM 19905-01.

Kenneth W. Busch received his BS in chemistry from Florida Atlantic University in 1966. In 1971 he received his PhD in analytical chemistry from Florida State University, where his research advisor was T. J. Vickers. From September 1971 to June 1972, he taught general chemis-

try at Florida State University as a postdoctoral teaching fellow. He is currently a postdoctoral fellow at Cornell University, where he is working with George H. Morrison on the development of multielement methods of analysis by flame spectrometry. In addition, his research interests include the development of spectroscopic instrumentation for analysis and the theory of spectrochemical excitation in flames and plasmas. Dr. Busch is a member of the American Chemical Society, the Society for Applied Spectroscopy, and a Fellow of the Chemical Society (London). He is also a member of Sigma Xi.

George H. Morrison, professor of chemistry and director of the Materials Science Center Analytical Facility at Cornell University, is one of the

leaders in the field of trace analysis and materials characterization. His current interests include atomic spectroscopy, mass spectroscopy, and neutron activation analysis, and he is a principal investigator in the Lunar Analysis Program of NASA. He is coauthor with Henry Freiser of the book, "Solvent Extraction in Analytical Chemistry," editor of the book, "Trace Analysis: Physical Methods," and author or coauthor of more than 110 publications. He received the 1971 American Chemical Society Award in Analytical Chemistry and is Chairman-Elect of the Division of Analytical Chemistry of ACS.
